

What's going on with electronics?

We have only just set off on the journey of increasing software content and complexity.

Article written by Mikeal Åkerholm, Head of product management, maximatecc, Sweden

“We have only just set off on the journey of increasing software content and complexity. We will see more information management and support system for the operator, owner and other stakeholder, implemented to manage machines for higher productivity, safety, availability and ergonomics. I believe we will see personal interaction and connectivity devices, i.e. the Smartphones,

Supads and Kinects of tomorrow, form an integral part of the operation and management of machines. We will not need a connector plugged into our necks, but we will be a powerful as Neo in The Matrix.

At Bauma, we will be showcasing a Smartphone app that enables easy retrieval of condition and diagnostics data to back-office support systems.”

iVT Magazine, March 2013
