# Chapter 1

## Main Page

### 1.1 Introduction

This documentation is generated from the CCAux source code. CCAux ([CrossControl Common Aux control](#)) is an API that gives access to settings, features and many hardware interfaces; backlight, buzzer, diagnostics, frontled, lightsensor and analog video interfaces.

The API is available for multiple platforms and operating systems: Linux on the C-Cpilot XA, XS, VC and XM products in all variations. For the XM and XL platforms, Windows XP, Windows 7 and 8 is also supported.

The known issues and changelog presented here also cover the following maximatecc applications (which are using the API and are released in conjunction with it):

- CCSettings
- ccvideo
- ccsettingsconsole
- touchcalibrator
- ccauxd

### 5.1.2.2 enum ButtonPowerTransitionStatus

Current status for front panel button and on/off signal. If any of them generate a suspend or shutdown event, it may also be read, briefly. When the button/signal is released, typically BPTS\_Suspend or BPTS\_ShutDown follows. Note: Do not rely on getting BPTS\_ShutDown or BPTS\_Suspend from user applications. The system is likely to start shutting down before the status can be read. Instead, use the PowerMgr class for handling system shutdown/suspend events.

### 5.1.3.212 EXTERN\_C CCAUXDLL\_API eErr CCAUXDLL\_CALLING\_CONV

**CrossControl::PowerMgr\_hasResumed ( POWERMGRHANDLE , bool \* *resumed* )**

This function can be used in a suspend-resume scenario. After the application has used `setAppReadyForSuspendOrShutdown()` to init the suspend, this function may be polled in order to detect when the system is up and running again. Calling this function before calling `setAppReadyForSuspendOrShutdown` will return `resumed = true`.

Supported Platform(s): XL, XM, XS, XA, VC

#### Returns

Example Usage:

#### Returns

error status. 0 = ERR\_SUCCESS, otherwise error code. See the enum eErr for details.

5.1.3.295 EXTERN\_C CCAUXDLL\_API eErr CCAUXDLL\_CALLING\_CONV  
 CrossControl::Video\_takeSnapshot ( VIDEOHANDLE , const char \* *path*, bool *bInterlaced* )

Takes a snapshot of the current video image and stores it to a bitmap file. This is a combination of takeSnapShotRaw, getVideoStandard and createBitMap and then storing of the bmpBuffer to file. To be able to take a snapshot, the snapshot function has to be active.

Supported Platform(s): XL, XM (Windows)

#### Parameters

<i>path</i>	The file path to where the image should be stored.
<i>bInterlaced</i>	If true the bitmap only contains every second line in the image, to save bandwidth.

#### Returns

error status. 0 = ERR\_SUCCESS, otherwise error code. See the enum eErr for details.

5.1.3.296 EXTERN\_C CCAUXDLL\_API eErr CCAUXDLL\_CALLING\_CONV  
 CrossControl::Video\_takeSnapshotBmp ( VIDEOHANDLE , char \*\* *bmpBuffer*, unsigned long \* *bmpBufSize*, bool *bInterlaced*, bool *bNTSCFormat* )

Takes a snapshot of the current video image and return a data buffer with a bitmap image. The bmp buffer is allocated in the function and has to be deallocated with freeBmpBuffer() by the application. This is a combination of the function takeSnapShotRaw and createBitMap. To be able to take a snapshot, the snapshot function has to be active.

Supported Platform(s): XL, XM (Windows)

#### Parameters

<i>bmpBuffer</i>	Bitmap ram buffer allocated by the API, has to be deallocated with freeBmpBuffer() by the application.
<i>bmpBufSize</i>	Size of the returned bitmap buffer.
<i>bInterlaced</i>	If true the bitmap only contains every second line in the image, to save bandwidth.
<i>bNTSC-Format</i>	True if the video format in rawImageBuffer is NTSC format.

#### Returns

error status. 0 = ERR\_SUCCESS, otherwise error code. See the enum eErr for details.

#### 5.1.3.297 EXTERN\_C CCAUXDLL\_API eErr CCAUXDLL\_CALLING\_CONV

CrossControl::Video\_takeSnapshotRaw ( VIDEOHANDLE , char \* rawImgBuffer, unsigned long rawImgBuffSize, bool bInterlaced )

Takes a snapshot of the current video image and return raw image data. The size of the raw image is when interlaced = false 0x100 + line count \* row count \* 4. The size of the raw image is when interlaced = true 0x100 + line count \* row count \* 2. To be able to take a snapshot, the snapshot function has to be active. This function is blocking until a new frame is available from the decoder. An error will be returned if the decoder doesn't return any frames before a timeout.

Supported Platform(s): XL, XM (Windows)

#### Parameters

<i>rawImg-Buffer</i>	Buffer for image to be stored in.
<i>rawImgBuff-Size</i>	Size of the buffer.
<i>bInterlaced</i>	If true the bitmap only contains every second line in the image, to save bandwidth.

#### Returns

error status. 0 = ERR\_SUCCESS, otherwise error code. See the enum eErr for details.
