CrossFire™ FX1

Introduction

The CrossFire™ FX1 is a compact, ruggedised and versatile I/O-module designed for mobile applications. The module has a generous I/O setup, making the price per I/O channel extremely competitive.

The CrossFire™ FX1 is a CAN bus node, and by configuring the node properties, the module can be set up to automatically send and receive I/O to and from the CAN bus network.

The CrossFire™ FX1 supports the CANopen protocol: one of the leading protocols used for CAN bus networks.

The CrossFire™ FX1 is highly configurable and has many different types of input and output drivers. All outputs, whether digital or analog can be configured as Digital Outputs, and almost all inputs can be configured as Digital Inputs. This provides a great deal of flexibility.

Functions and Features

- » The CrossFire™ FX1 is a CiA DS 401 I/O module, designed for automotive products equipped with hydraulic components. It has 77 I/O ports which can be individually configured to provide various types of I/O. The CrossFire™ FX1 can therefore be configured to have:
 - Up to 35 Digital Inputs, of which 6 are debounced in hardware
 - Up to 42 Digital Outputs
 - 28 High-Side Drivers (PNP) with overload/short-circuit protection
 - 14 Low-Side Drivers (NPN)
 - Up to 20 PWM (Pulse-Width Modulation) Outputs
 - 14 of which are Regulated
 - Up to 9 Pulse Counter Inputs, of which 2 accept sine wave inputs
 - Up to 34 Analog Inputs
 - 14 of which are normally used for Regulated PWM Feedback
- » In addition to the 77 I/O ports mentioned above, there are internally
 - 8 Analog "Power Monitor" Inputs
- » Configurable using SDOs (Service Data Objects)
- » 8 dynamically-mapped PDOs (Process Data Objects) compliant to DS 401
- » Supports use of synch object (synch object consumer only)
- » Support for both heartbeat and node guarding
- » The CrossFire™ FX1 is an EMCY (Emergency) object producer. The COB ID of the EMCY object can be configured.
- » Status bits for 14 of the High-Side Drivers sent by default with TPDO1.
- » Storage for up to 127 Error codes
- » Reset function restores settings back to their factory default values.

Dimensions

The CrossFire™ FX1 dimensions are illustrated below. The placement of the bolt holes is symmetrical. The mounting lugs have clearance for 8 mm bolts. The minimum clearance required to connect the mating harness is 67 mm. The weight of the module is 0.88 kg.

Identification

There is a label on the front of the CrossFire™ FX1. On the label there are numbers which identify your unique module. Take note of them. During service and other contact with the supplier it is important to be able to provide these numbers.

Environmental Tolerance

The CrossFire™ FX1 has been designed to cope with tough environmental demands. Strict tests have been conducted on the unit in order to ensure that it fulfills the expectations of a rugged unit. Much work has been performed to choose and design integral components so that they, in the best possible way and under all circumstances, provide you with a dependable working instrument. In Appendix 1, a list of standards can be found according to which the CrossFire™ FX1 has been tested and approved.

Despite thorough design requirements and testing specifications, it is always best to install and handle the CrossFire™ FX1 with care. For more information, read further.

Installation

Your CrossFire™ FX1 should be installed in such a way that the module is not exposed to any unnecessary stress, heat, vibration or moisture. In this section, some recommendations are made regarding methods for how the unit should be installed.

If the unit is opened by non-authorized personnel, the warranty becomes void.

Cooling

Although the CrossFire™ FX1 can operate in relatively high temperatures, cooling should still be considered when installing the CrossFire™ FX1. If the unit becomes too warm, it may not perform to its full capacity and, with high temperature, cease to function.

Inadequate cooling may lead to overheating, causing permanent damage to the unit.

Vibration

We recommend installing the CrossFire™ FX1 in such a way that it is not unnecessarily exposed to vibration or other stress.

Rain / Moisture

The CrossFire™ FX1 shall preferably be covered or enclosed in order to prevent direct exposure to water.

Electrical Interface

Connectors

Every I/O pin on the CrossFire™ FX1 is assigned a unique port. The ports are numbered from 1 to 94. Some ports are internal. Most ports may be configured individually in software to one of 5 different I/O types. Not all I/O types are available on all ports.

The port assignments of the CrossFire™ FX1 are sequential and unique but the pin assignments are somewhat arbitrary. For I/O interface by order of port number, see Appendix 2.

Electrical Interface Overview

The following illustration consists of several boxes which represent the main functional groups on the CrossFire™ FX1. The arrows leading to and from the functional groups represent I/O, power or communication busses. The illustration shows the FX1 in its default configuration. The configuration can be changed by writing to the object dictionary at address 0x2000.

Ports 16, 26 are undefined. Ports 27–29 and 77–80 are internal inputs

Electrical Interface Characteristics

Digital Inputs

There are 5 types of Digital Inputs available on the CrossFire™ FX1 for a total of 35 ports. Only 6 of them, on ports 1 to 6, are available by default. If more Digital Inputs are needed, the desired ports must be configured by writing an SDO to index 0x2000 of the Object Dictionary. Port assignments and characteristics are presented below. The characteristics of the Digital Inputs which are borrowed from the Pulse Counters and Analog Inputs are, however, not included here. These characteristics can be determined by referring to the appropriate chapters.

Pulse Counter Inputs

There are 2 types of Pulse Counter Inputs available on the CrossFire™ FX1 for a total of 9 ports. The ports are configured as Pulse Counter Inputs by default.

The port assignments and corresponding electrical characteristics for the Pulse Counter Inputs are presented in the tables below.

	Input Frequency 50% duty cycle from 5 Vp-p	0.2 Hz		500	kHz	sine wave

Analog Inputs

Ports 7 to 15 and ports 30 to 40 make up the 20 Analog Inputs which are available by default.

Ports 81 to 94 form the Low-Side of the Regulated PWM Drivers. Whether acting as part of the Regulated PWM Driver circuit, or as standalone Digital Outputs, these ports are always readable as Analog Inputs without any configuration changes. If a particular Regulated PWM Driver is not being used, this frees up the corresponding Low-Side Driver to be used as an “extra” Digital Output/Analog Input.

When Ports 61 to 74 are being used as Regulated PWM Outputs, it is recommended to reserve the use of corresponding Regulated PWM Returns (Ports 81 to 94) as feedback paths.

The port allocations and electrical characteristics of all Analog Inputs are given in the tables below.

Digital Outputs

There are 3 types of Digital Outputs on the CrossFire™ FX1 for a total of 42 Ports. Ports 49 to 54 and 61 to 74 are configured as PWM Outputs by default, and require reconfiguring if they are to be used as Digital Outputs. To reconfigure the ports, see 0x2000 in the Object Dictionary.

Ports 81 to 94 are the Low-Side Drivers.

When Ports 61 to 74 are being used as Digital Outputs, it is permissible to tie the low side of the loads to ground. However, when being used as Regulated PWM Outputs, it is recommended to reserve the use of corresponding Regulated PWM Returns (Ports 81 to 94) as feedback paths.

The port allocations and electrical characteristics of all Digital Outputs are given in the tables below.

Ports 41 to 54 are equipped with Status Bits. There is one Status Bit for each pair of ports. If a Status Bit is set, it indicates a failure with one (or both) of the Ports it represents.

Regulated and Non-regulated PWM Outputs

Regulated PWM Outputs consist of two driver circuits operating in tandem. Namely, one Analog High-Side Driver and one corresponding Low-Side Driver. The High-Side Drivers provide Regulated PWM Output capability, with the help of current feedback signals (called Regulated PWM Return) from the Low-Side Drivers. The regulation is performed in hardware.

When Ports 61 to 74 are being used as Digital Outputs, it is permissible to tie the low side of the loads to ground. However, when being used as Regulated PWM Outputs, it is recommended to use the corresponding Regulated PWM Returns (Ports 81 to 94) as feedback paths.

Note: to use the Low-Side Drivers (Ports 81 to 94) as Regulated PWM Returns, no configuration change is required. Simply connect the low side of the Regulated PWM load to the corresponding Regulated PWM Return Port.

Low-Side Driver Digital Output Ports, must be set to a “logic 1” (thereby closing the circuit) in order for the port’s Regulated PWM Return signal to be valid. This is done through receive PDO1 bytes 5 and 6.

Furthermore, the current in each Regulated PWM Return continues to be read as an Analog Input without any configuration changes. Non-Regulated PWMs do not have PWM Return signals, and are therefore controlled “open loop”.

The PWM Outputs are intended to drive servo valves. Because of this, all PWM outputs are equipped with Ripple Frequency and Ripple Amplitude settings. This is intended to overcome valve static friction with a subtle vibration, keeping the valve

spool in motion. This feature is enabled by default, and can be modified at indices 0x2004 and 0x2005 of the Object Dictionary. The PWM Frequency can also be adjusted using index 0x2006.

Note that the Valve Power listed below is also used by the Digital Outputs.

Power Interface

Power is supplied to the unit through 6 different Power Input lines. Each line must be protected with an external 20-Amp ATC fuse.

All 6 of the Power Inputs and the two +5 V Reference Outputs are able to be monitored as Analog Inputs.

The 4 Valve Power Inputs directly supply the Digital and PWM Outputs of the CrossFire™ FX1. They are independent of other's circuitry and as such may have different voltage levels.

CrossFire™ FX1

CANopen Interface

Parameter Overview

The CrossFire™ FX1 supports the CANopen protocol.

The default CANopen Node ID is 1 and the default Baud Rate is 125 kbit/s.

The CrossFire™ FX1 supports both heartbeat and node guarding.

The CrossFire™ FX1 is an NMT slave device. It is a heartbeat producer.

The CrossFire™ FX1 is a SYNC message consumer.

EMCY Object Overview

The following error codes are supported according to DS-401 and DS-301. Up to 127 errors codes are stored at index 0x1003 of the Object Dictionary.

EMCY Object

Error code	Error register	Manufacturer-Specific Error Field	Meaning
0x8110	0x1	Not used	Buffer overrun. A CAN buffer overrun has occurred in the CrossFire™ FX1. Index 0x1029 specifies the action to take when this error occurs.
0x6100	0x1	SW error code	An internal software error has occurred. This error can be a result of a bug in the software. Please note the manufacturer specific error field of the message, and report the error to CrossControl. Index 0x1029 specifies the action to take when this error occurs.
0x8130	0x1	Not used	Guarding of node failed. This will occur if the CrossFire™ FX1 is guarded with Node Guarding and the master has failed to send a guarding remote frame within the time specified in object 0x100C. Error will also occur if the CrossFire™ FX1 is configured as a heartbeat consumer with object 0x1016 and another node has failed to send its heartbeat message. Index 0x1029 specifies the action to take when this error occurs.
0x8210	0x11	Not used	PDO not processed because of length error. A PDO with the wrong length has been received and thereby ignored. Index 0x1029 specifies the action to take when this error occurs
0x8140	0x1	Not used	The CrossFire™ FX1 has recovered from Bus off.
0x8120	0x1	Not used	The CrossFire™ FX1 has recovered from CAN error state.
0x1000	0x1	0x1	The CrossFire™ FX1 runs in EEPROM Error mode. This means that the EEPROM has malfunctioned. The CrossFire™ FX1 reverts to the default values for EEPROM, instead of the real values in EEPROM. The CrossFire™ FX1 can still work as desired if all the desired settings are sent by SDOs at startup.

Receive PDOs: Digital Outputs and PWM (Analog) Outputs

The CrossFire™ FX has 14 Digital High-Side Drivers. The first 8 (ports 41 to 48) are configured as Digital Outputs by default. The last 6 (ports 49 to 54) are configured as Non-regulated PWM Outputs.

The CrossFire™ FX also has 14 Regulated PWM Drivers, which consist of an Analog High-Side Driver and a Low-Side Driver each. Any pair of ports from the Regulated PWM Drivers can be reconfigured to act as two Digital Outputs.

To reconfigure the required ports, see Object Dictionary, index 0x2000 with the sub-index corresponding to the appropriate High-Side Driver port(s). The Low-Side Drivers require no reconfiguration.

	6,7 - X		6,7 - X		6,7 - X		

Only bits that correspond to Ports configured as Digital Outputs will be used

Ports 49 to 54 are the Non-regulated PWM Outputs and Ports 61 to 74 are the Regulated PWM Outputs. These PDOs are configured by default, except PDO 5 and 6. The communication parameters are set up beginning at index 0x1401 and the mapping parameters begin at index 0x1601.

Transmit PDOs: Digital Inputs and Analog Inputs

This section describes the Transmit PDO information from the CrossFire™ FX1. The information transmitted over the CAN bus represents the state of the CrossFire™ FX1 inputs.

The CrossFire™ FX1 is highly configurable, and although there are only 6 default Digital Inputs, many of the other inputs can be configured to act as Digital Inputs as well. The ports are reconfigured by sending an SDO to the Object Dictionary at index 0x2000. The sub-index corresponds to the port number. For further information, see description in the Object Dictionary

Transmit PDO 1:

- » Only bits that correspond to ports configured as Digital Inputs are valid
- » "X" denotes unused bits.

The following Analog Input ports can be configured as either Digital Inputs or Analog Inputs. By default, they are all configured as Analog Input ports. The configuration is set up by writing the appropriate SDO to the manufacturer-specific entries in the Object Dictionary at index 0x2000.

The mapping between Analog Inputs and the Object Dictionary follows the DS401 standard. The information is stored at index 0x6401, the Communication parameters at 0x1801 and the mapping parameters begin at 0x1A01. By default, the PDOs of the node are mapped to the I/O as follows:

Transmit PDO 2:

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Analog Input Port 7		Analog Input Port 8		Analog Input Port 9		Analog Input Port 10

Transmit PDO 4:

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7	Byte 8
Analog Input 15		Analog Input 30		Analog Input 31		Analog Input Port 32	

» Additional Transmit PDOs: PDO 5 to PDO 17

The CrossFire™ FX1 has more Analog Inputs available than those shown in Transmit PDO 2, 3 and 4. However, since the 401 standard allows for a total of only 4 TPDOs by default, the remaining analog inputs will not be transmitted unless the user explicitly requests them during the pre-operational stage by sending the appropriate SDOs to configure the CrossFire™ FX1 to send the additional information.

The following additional PDOs are already mapped but need to be enabled in order to be transmitted. Several unused CANopen Node IDs must be set aside in order to enable all of the Additional PDOs listed below. See description of the Object Dictionary for further details.

» Notes on Communication Profile Area

COB IDs are determined using a bitwise OR operation as follows:

Standard COB ID format: Base (hex) + Ynnn (hex)
 COB ID format for additional PDOs: Base (hex) + Yxxx (hex)

Where,

nnn = node ID of this node,
 xxx, yyy, etc. = an unused node ID.
 Node's ID, 1 = use nnn directly.

Y bit 0..1 reserved
 Y bit 2 : 0 = add nnn to this
 Y bit 3: 0 = PDO enabled, 1 =
 PDO disabled

Mapping Address

The mapping area controls where the received data in the receive PDOs will be stored. If these values are not changed then the default values will be used, the default value can be read as follows:

E.g.: 0x62000108

0x6200 = address in manufacturer specific area of Object Dictionary.

0x01 = sub index 1 (0x0A = sub-index 10, 0x10 = sub-index 16, etc)

0x08 = 1 byte (0x10 = 2 bytes, 0x20 = 4 bytes, etc.)

0x2004			100		PWM Ripple Frequency in Hz. The PWM Ripple frequency is used for adding a ripple to the PWM Outputs. By using a ripple the coil is always in motion, thereby eliminating the “start energy” that is otherwise needed when changing the value of the PWMs. This makes the controlling of the coil more linear. Default value is 100 Hz. Maximum is 500 Hz.
0x2005			100		Ripple Amplitude.

Index	S-idx	Type	Default (possible)	Saved to EEPROM	Description
					This is the amplitude of the ripple for the PWM Outputs. Possible values are 0 – 2000, and these values are on the same scale as the output values of the PWMs. For example, if the user sets the ripple amplitude to 100, and sets the output of a PWM to 1000, the output will ripple between 900 – 1100. If instead the ripple amplitude is set to 200, the ripple would be 800 – 1200. Default value is 100.
0x2006			1000		PWM Frequency in Hz. The PWM frequency is the base frequency of the PWM Outputs. The maximum value is 1500 Hz. This frequency should be greater than the ripple frequency. Default value is 1000 Hz
