Change notification – Release of CCSimTech 2.9.1

CrossControl AB is releasing a new version of CCSimTech including performance improvements in licensing and SimCan.

Licensing

The new version of CCSimTech will not require a new license. When installing the new version of CCSimTech the old license registered on the computer will be discovered. With the introduction of two license levels an old license, before version 2.7.0, is equal to the new *Developer* license which has no limitations.

If you don't have a valid license for CCSimtech install the new version and follow the instructions in CCSimTech help to request a license.

New possibilities

With this release of CCSimTech 2.9.1 there are a number of new features:

- Possible to connect simulated serial ports to any physical serial port, not only COM1-COM4.

Improved stability and bug fixes

In this release, as usual, efforts are put on stability; a number of improvements have been made:

- Problem with license warnings on high performance computers solved.
- Performance of CanSend in periodic mode improved.

And also many small improvements are made for better stability in all CCSimTech components.

Functional implications when shifting to CCSimTech 2.9.1

This version is backwards compatible with version 2.7.x.

Validation of the new revision

We have performed extensive testing of the new version to make your transition as smooth as possible. We however strongly recommend that you perform your validation testing of the new release in your application before release for commercial use.

For further information or assistance please contact the CCSimTech support team (CCSimTech-support@crosscontrol.com).
